DyneAquaculture Visits European Aquaculture Partners – March 2017

Jim Marstiller and Jon Anson from DyneAquaculture, along with several of their partners, visited the leading aquaculture companies in Norway, Denmark, Germany and Switzerland which whom they have become affiliated. The 10-day visit was part of the DyneAquaculture preparation process for launching several projects in the U.S. later this year.

Seeing is believing.

“It’s just amazing to see how rapidly over the past few years the land-based RAS technologies are progressing and the remaining issues have been sorted” said Marstiller.

It’s one thing to exchange emails and texts and to view videos and have international teleconferences, but it’s a different thing to see large healthy fish swimming in high quality water.

It was very satisfying to visit the various centers of excellence – from RAS facilities to aquaculture feed mills - and appreciate the work that has gone into making an economically viable and integrated enterprise. The breadth and depth of technological and biological knowledge upon which the industry now stands is both awe inspiring and humbling.

It was an incredible trip and we look forward to the next steps. Over the past three + years we’ve invested over 30,000 hours into our due diligence process and visited with the industry leaders many times. It never ceases to amaze me however, just how valuable this actual “boots on the ground” time is with our partners.

For Anson, it is all about a repeatable process, execution and feedback loops. “I never stop thinking about, even obsessing over, operational excellence, risk mitigation and feedback loops to make the process better. We have a great team.”
